

Sol-3 completes new customer installation to Deribit in less than 24 hours with infrastructure partner Black Dragon

Today the independent trading software vendor Sol-3 announces that this week a new customer installation to the crypto exchange Deribit was fully installed, configured and deployed in production within 24 hours after signing the contract.

This also includes the entire hardware installation in the Equinix Slough datacentre by the fellow company Black Dragon.

Thus, shortly after the final decision for Sol-3, the client can use all the advantages of the professional trading software.

Norbert Geus, Managing Partner Sol-3, says: *This project exceeds my expectations and it proves the excellent cooperation with our partners Deribit and Black Dragon. It also illustrates the speed and simplicity of a new installation of the Sol-3 system. For our clients, this not only means being able to start trading faster to generate trading profits, but it also reduces operational costs through significantly reduced project times.*

Jurre ten Berge (CCO) at Black Dragon states: *“For us as an infrastructure provider, it is crucial to have software partners that can deliver timely benefits to our customers, provide a stable and reliable system that is also easy to install and maintain. The Sol-3 system has been a good choice for many years. The very good cooperation with Sol-3's technical support also plays a decisive role.”*

About Sol-3:

For more than 20 years Sol-3 has been a software specialist of sophisticated exchange trading systems for professional electronic trading. The software product is specifically designed to meet the needs of proprietary trading firms, with a clear focus on trading speed. Especially equity and derivatives traders, market makers, arbitrage traders and algo-traders will mostly benefit from these key advantages. In addition to all essential manual trading functions, the system offers precise theoretical price calculations for derivatives, automatic quote management for market-makers, automatic rule-based trading on market opportunities and a very fast and flexible order /quote management to exchanges, order routing systems and brokers. Customers benefit from comprehensive customer service, deep technical expertise and the experience of numerous projects connecting trading companies to electronic exchanges worldwide.
